# Data-Driven Medicine

## Core Unit eHealth & Interoperability (CEI)

---

### Goals:

- ❖ Promote the use of international standards and terminologies
- ❖ Enable communication and analysis of medical data across institutions
- ❖ Advance the use of digital technologies in medical research, patient care (mobile health applications, big data analytics, precision medicine) and eCommerce

*“Our vision is an interconnected digital health infrastructure that enables new technologies (AI, Smart Data Analytics) to predict disease more accurately, develop personalized treatments and diagnostics, promote active patient participation, and ensure high data security.”*

# Interoperability

Interoperability is the ability of different information systems, devices or applications to connect, in a coordinated manner, within and across organizational boundaries to access, exchange and cooperatively use data amongst stakeholders, with the goal of optimizing the health of individuals and populations. *HIMSS*

# Worldwide Cooperations (Ministries, Science, E-Health Competence, EU, APPLE, IBM, Amazon, GOOGLE, MS,..)

**Joint Initiative on SDO Global Health Informatics Standardization**

The **Joint Initiative on SDO Global Health Informatics Standardization** is formed to enable common, timely health informatics standards by addressing and resolving issues of gaps, overlaps, and counterproductive standardization efforts through:

- » A mutually agreed upon and used decision process for international standardization needs;
- » Coordinated standards strategies and plans, with the future goal of making all standards available through ISO;
- » An integrated work program; and
- » Focused, specific resolution of overlapping or counteracting standards within the participating SDOs existing work programs.

This Council, operating as a council of equals and as a liaison group under ISO/TC 215, consists of the respective leaders and appointed liaison members of the participating SDOs to a maximum of 3 members per SDO.

# Use of international standards - Norway

Focus in this presentation:

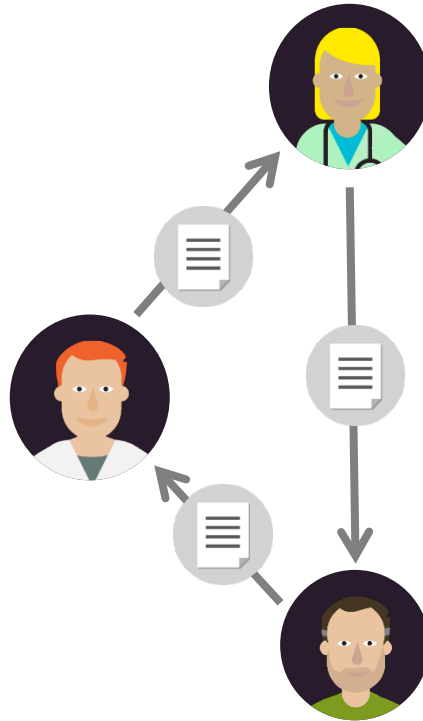

- Data sharing/ APIs
- FHIR
- Roadmap for international standards

# Exchange paradigms

Messaging

Document sharing

Data sharing/ API

# Data sharing/ APIs

Image-information

Diagnosis

Systems can retrieve necessary information on-demand...

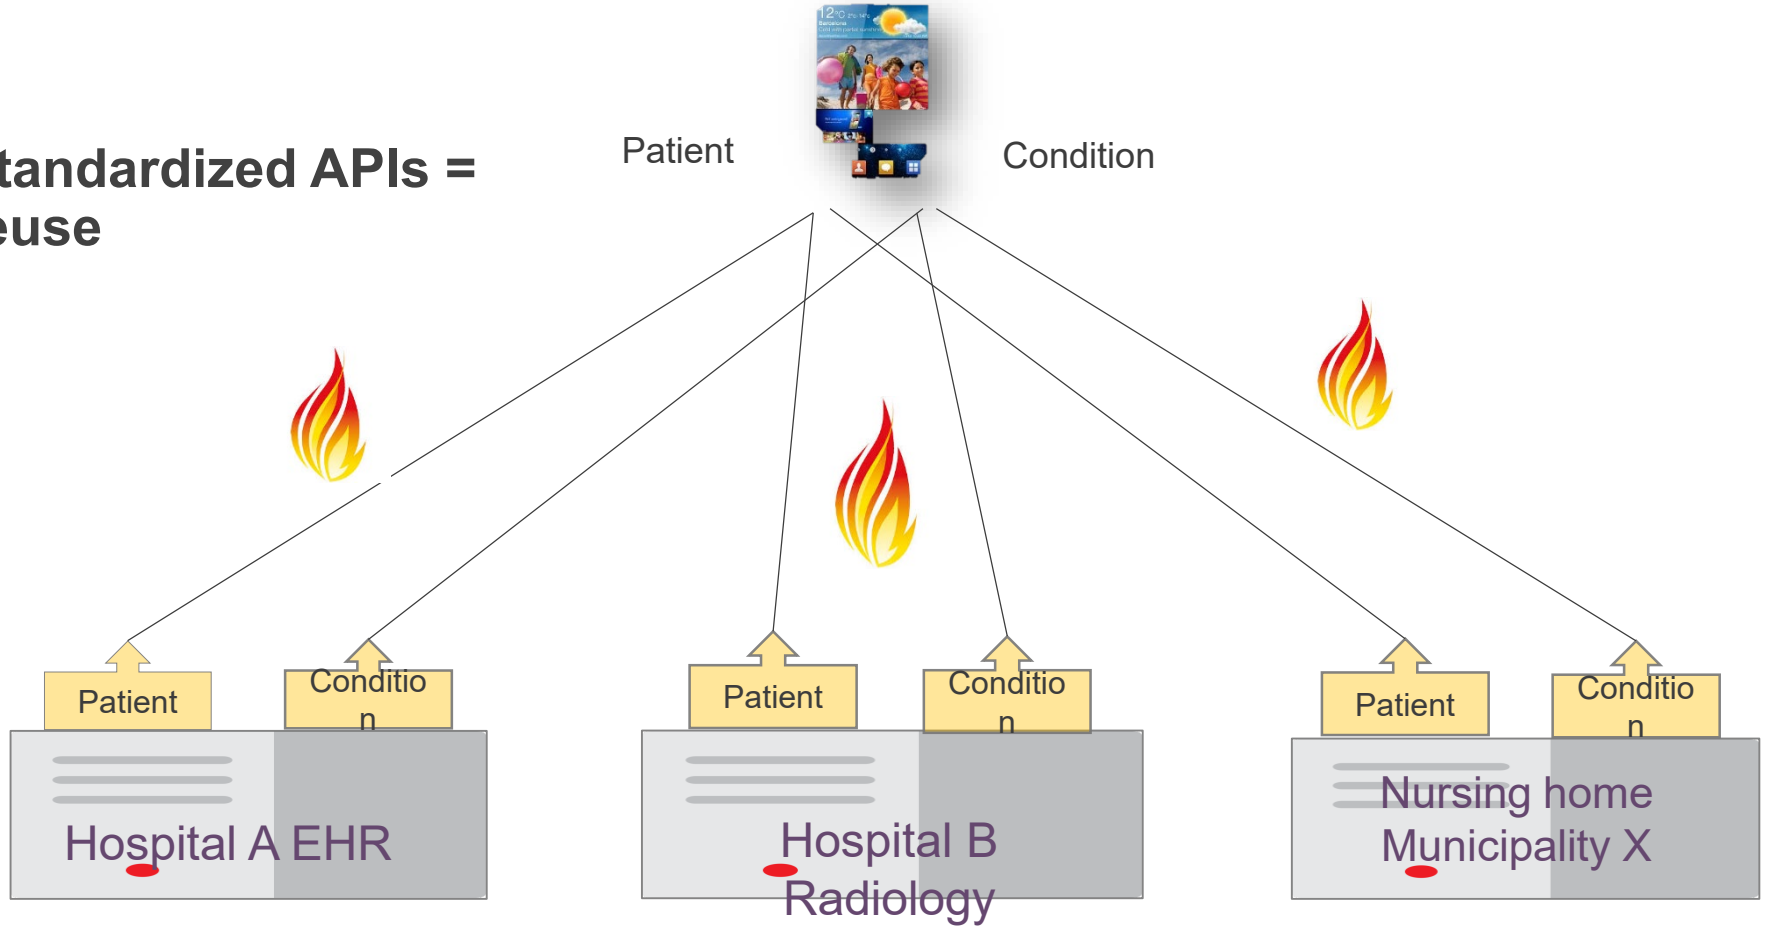

# Fast Healthcare Interoperability Resources

- FHIR is a free and open standard developed by HL7 International.
- FHIR describes information content that is exchanged between clinical systems.
- FHIR was developed for use in APIs, but the information structures can also be used for messaging and document sharing.
- FHIR represents a more agile approach to standardization.
- FHIR can be adapted to most use-cases
- FHIR has a broad and very active international community
- FHIR focus support on common scenarios (80%)
- Basic principles - ease of use for developers

# Standardized APIs = reuse

# International adoption FHIR

# Areas in development

- Building a national community of regulator, sector and vendors to work together on standards development.
- Developing more specific guidance on how to use international standards in some functional areas:
  - Health- and quality registries
  - Medical devices
  - Logistics and supply chain
  - Questionnaires
  - Use of standard information models with ontologybased terminologies (SNOMED CT)

# Questions?

# HL7 standards

Together we are stronger

## Experience from the Netherlands

Experience the commitment<sup>®</sup>

Director Consulting,  
Health & Health Tech,  
CGI, the Netherlands

Dr Robert A. Stegwee  
Board Member, HL7 Netherlands  
Chair, CEN/TC 251 Health Informatics  
Member, Joint Initiative Council

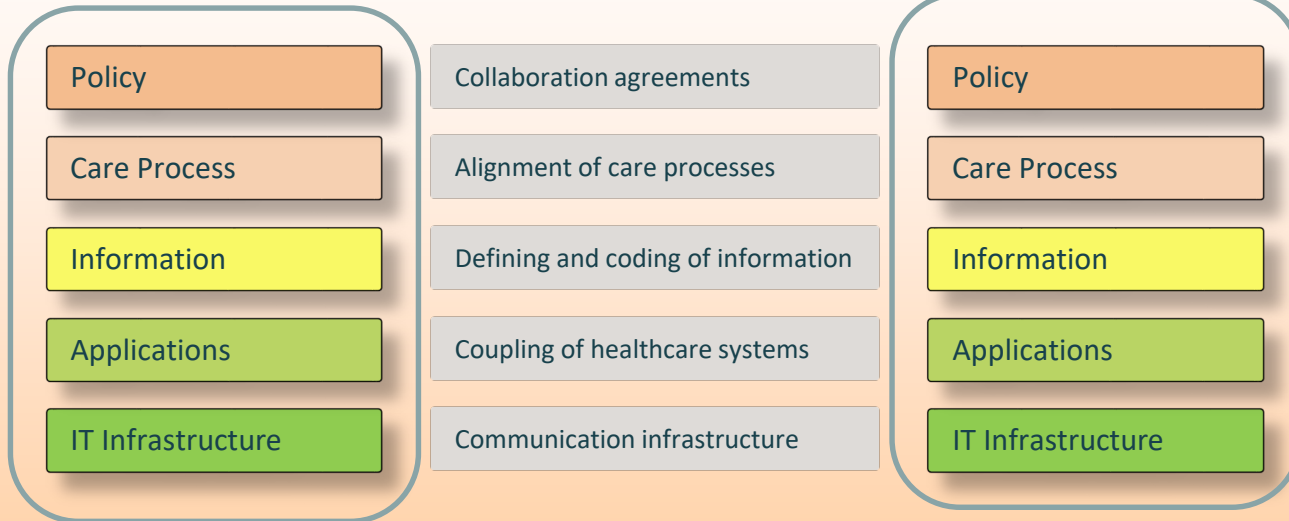

# Standards Developing Organizations

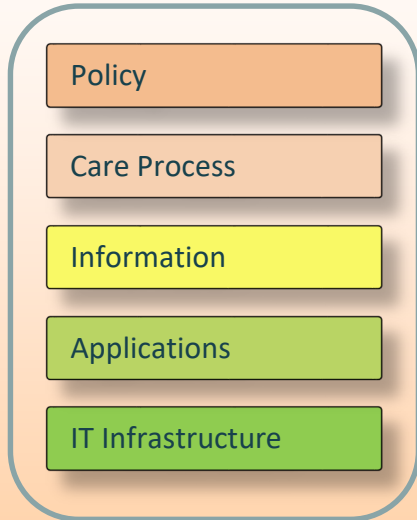

Betere gezondheid  
door betere informatie

# No single standard is sufficient

# National goals are being set

Healthcare Information Council

SDO Council

# Main goals of the SDO Council

- ▶ To have an environment in which to have an efficient and effective standards debate
  1. Coordinate, because multiple standards will usually contribute to a single solution
  2. Identify *overlaps* between standards and agree to actions to avoid them
  3. Identify *gaps* between standards and agree to actions how to solve them
  4. Provide insight into the dependencies between standards
  5. Provide (independent) advice to stakeholders

# Aligned with the global JIC

- (a) promote interoperability and seek to avoid overlaps between standards used in health informatics;
- (b) achieve greater coordination and consistency of health informatics standards development;
- (c) identify gaps in meeting the needs of members and their stakeholders for health informatics standards

...

# Agreement for the SDO Council

1. Inform each other of new initiatives, allowing the other members to question and comment
2. Agree on actions in support of the goals
3. Inform each other of international developments
4. Bring key NL developments to the attention of the international standards community
5. Create and maintain an overview of actions
6. Be open to participation of other organizations contributing to standards when and where needed

# A few key achievements

- ▶ Uniform Barcode Processing (UBP)
  - Orthopedic Implant Registry
  - Medication Administration
- ▶ More awareness of and involvement in European activities
  - International Patient Summary - CEN/HL7

# Questions?

**Panel II – Standards organisations – together we are stronger**

# Why SDO governed specs

- As a hospital we need the specs (recipe) so we can tell the vendors what we want in e.g. tenders
- Currently every hospital asks the vendor and we have a system full of proprietary stuff that is not maintainable and can become very expensive
- **We want SDO governed specs, so a vendor has to implement only once**
- Scanning and storing in EHR – the standard is here, now implement it
  - takes time to get the stakeholders (hospitals and software vendors) involved and ready to implement
- Then we can move on to the specs for registries
