Definitions

- **Multiple dose blister**
  - Package which fully encloses the drug.
  - Each dosage form is individually packaged. The individually blistered identical dosage forms are attached to each other to one strip.
  - The labelling is imprinted on the complete strip but not on the individual blistered dosage forms.
Definitions

**Unit dose package**

- A unit dose package contains the particular dose of the drug for a **specific patient** according to the patient-specific prescription.
- Unit-dose packages are dispensed for one or several days by a centralized supply service unit and are labelled specifically for a patient.
Definitions

- **Single dose blister package**
  - Drug blister package for a single dose. A number of single doses might be attached to each other, but are easy to separate through a perforation.
  - Each single-dose is individually and fully labelled.
**History**

- The General Assembly (GA) June 2006 decided to ask the board of director to promote single dose for medicines used in hospitals

- Working group
  - Prof. Pascal Bonnabry, Switzerland
  - Dr. Steffen Amman, Germany
  - Sophie Verbeke, Belgium
  - Dr. Roberto Frontini, Germany

- Statement of EAHP after approval by the GA June 2007, update **2010**

- Press release April 2008 about the importance of single dose in terms of patient safety
Activities

- **September 2007, Brussels**
  Meeting with EFPIA

- **November 2008, Paris**
  Meeting with Sanofi-Aventis

- **September 2009, Basel**
  Meeting with Novartis
Who is supporting the Single Dose

- **European Commission**

  - “European guideline on the readability of the label and package leaflet of medicinal products for human use”
    - *September 2006*

  Section C.1, “Blister pack packaging”:

  “Where a unit-dose blister presentation is proposed, all the information required for blister packs *must appear on each unit presentation*”
Who is supporting the Single Dose

- Council of Europe
  - Report
    "Creation of a better medication safety culture in Europe: Building up safe medication practices"
    19th March 2007

- EDQM Group Track and Trace Integration of Pharmacies
  14th January 2010
Who is supporting the Single Dose

- FDA

- Since April 2006 in USA mandatory for all hospital products

  October 2006
Who is supporting the Single Dose

- Pharmaceutical industry

Statement by EFPIA (fighting counterfeit)
October 2009

“EFPIA calls for the introduction of a harmonised coding solution in Europe, based on the two-dimensional barcode .... to individually code each pack”
**Statement by EFPIA**

* 2D Datamatrix
1) Product/Manufacturer Code 14 digits [GTIN recommended]
2) Unique Serial Number 20 digits
3) Batch Number 10 alpha-numeric characters
4) Expiry Date 6 digits (yy/mm/dd)

Focus on medication errors and patient safety
Medicines in hospitals

Pharmacy → Ward → Nurse → Patient

Pharmacy → Unit Dose Compounding → Nurse → Patient

Medication error
Medication errors

- Prescription: 39%
- Transfer: 12%
- Logistic: 11%
- Administration: 38%
Why bar coded single dose in hospitals

- To guarantee the permanent identification of a pharmaceutical product and secure its traceability within the hospital medication chain essentially in order to prevent medication-related errors

- Barcode technology reduces errors by 41.4% (11.5% ⇒ 6.8% absolutely)*

- i.e. every 21st patient will have a benefit (NNT** = 21)

** NNT = Number Needed to Treat
Medication errors: effect of bar-coding

Error reduction by 67%

Error reduction by 51%

Prescription  Transfer  Logistic  Administration

39%  12%  11%  38%

Why bar coded single dose in hospitals

- To avoid mis-reading and understanding of labels

- There is no common technology to read the product information by means of technical equipment and therefore no homogeneity, neither from manufacturer to manufacturer, nor from country to country
Why bar coded single dose in hospitals

- To alert faster and better on potential interactions

- To avoid risk of degradation of medical products form bulk containers (without packaging) because they could be sensitive to moisture, light or temperature
Why bar coded single dose in hospitals

- to protect children and help the elderly patients
- to reduce waste costs and raw material costs for repackaging in unite dose
- to reduce staff costs (time spending on repackaging and manually labelling)
Why bar code in hospitals

- To make the process of compounding and reconstitution more safe
In hospitals, personalized treatments are prepared in the pharmacy or in the ward, and are administered by nurses to the patients.

A complete and unambiguous identification of the drug up until the moment of administration is a **key element of a safe dispensing procedure**...
…when drugs are dispensed in multiple dose blisters, they have to be cut during drug dispensing, and, as a consequence, some information may be absent of the resulting dose and an accurate control at the bedside is no more feasible.
A. The primary packaging of a medical product must fulfill 3 basic functions:

- precisely describe the content of the drug up to final control at bedside
- enable easy and safe use of the drug
- provide protection against environmental influences such as light, moisture, pressure and microbial contamination during transport, handling and storage.
B. Requirements for the single dose packaging

1. Size and form

- single dose packing for a single application, preferably in a standardized size (e.g. 3,5x3,5 cm)
- alternatively, perforated multiple dose blister packs that can be easily divided into single doses packing (each of them must contain the whole information)
- ready to use, no further manipulation necessary
- easy to pack into automatic dispensing systems.
2. Information on the single doses

- The printing must be easy to read, durable and clear.
- Each single dose must contain the:
  
  - trade name
  - application form
  - active substance(s)
  - quantity of active substance(s)
  - manufacturer’s name
  - expiry date
  - batch number

  - barcode including the identification of the drug (GTIN), the expiry date and the batch number.

When the production facility is incompatible with an on-line printing of variable data, the barcode can temporarily be limited to the identification of the drug.
Hospital pharmacists strongly recommend the use of a recognized international standard, like the GS1 (ex- EAN) identification system for bar codes.

The GS1-128 (ex- EAN-128) standard appears to be the best standard for the traceability of single dose units.

Taking into account the problem of the available space, we recommend printing it as a bi- dimensional barcode (i.e. datamatrix).

For ampoules and vials, the same information should be provided on a label (not engraved on the glass), with additional information regarding the

- Total amount and volume (x mg = y ml) and the concentration of the solution (z mg/ml).
Take home messages

- The use of bar coded single dose reduces medication errors by 41.4% and is an important contribution to patient safety in hospitals
- EAHP requests the regulators to make bar coded single dose blisters mandatory for hospitals
- EAHP requests industry to pack all medicines for hospitals in bar coded single dose blisters
- The collaboration with industry is crucial to achieve this goal
Thank you very much for your attention!
