# 1. Business Domain View

## 1.1. Problem Statement / Business Need

Not Applicable

## 1.2. Objective

The objective is to document the components that are shared by GS1 BMS Standards in order to promote interoperability across GS1 domains (e.g. GDSN, eCom). This document contains only components that are determined to be foundational to the eCom domain within GS1.

eCom components are used to enforce consistency across eCom messages and include:

- Transactional trade item details
- Transactional party details
- Logistic unit details
- Transport related information such as transport equipment, transport means.
- Financial information such as payment terms, financial accounts.

eCom components will be contained in a separate package and will be carefully managed to ensure that any changes that are made to any component do not have a negative impact across GS1 eCom messages.

## 1.3. Audience

The primary audience for this document are individuals assigned as GS1 Business Process Analysts, Business Requirements Groups Managers, GDD Managers, and XML System Developers who are responsible for the completion and delivery of the Business Message Standards.

<b>GS1 Code List Version</b>	<b>1 (September 2011)</b>

Code Value	Code Name	Code Definition
CUSTOMER_DESTINATION_LOCATION	Customer destination location	Filters the location scope specified by a RECEIVING_LOCATION to include only those locations of a certain type. For example, if the RECEIVING_LOCATION is CHAIN (normally all locations within the chain), CUSTOMER_DESTINATION_LOCATION can be set to DISTRIBUTION_CENTER to indicate that the locations should only include the distribution centres within the chain, not other types of locations (such as stores). Because it is a filter, CUSTOMER_DESTINATION_LOCATION does not have a corresponding location value.
LOCATION_CONTEXT	Location context	Defines the overall range of locations from which a selection of locations may be made. For example, the location context could be set to COUNTRY with a value of "FR" (France). Then if the LOCATION_SELECTION is set to CHAIN with the corporate GLN value of a retailer, the result is that only those retailer chain locations within France would be within the scope of the calculation.
LOCATION_SELECTION	Location selection	Describes the specific set of locations to be measured within a broader location context. For example, if the LOCATION_CONTEXT is CHANNEL, with a value of Grocery, and the LOCATION_SELECTION is POSTAL_CODE, with a value of 01742, only grocery stores within the 01742 postal code would be within the scope of the calculation.
RECEIVING_LOCATION	Receiving location	Identifies the facility or a range of facilities that are at the destination of a delivery.
SHIPPING_LOCATION	Shipping location	Identifies the facility or a range of facilities that are at the origin of a delivery.
VENDOR_LOCATION	Vendor location	Filters the location scope specified by a SHIPPING_LOCATION to include only those facilities of a certain type. For example, if the SHIPPING_LOCATION is SUPPLIER (normally all locations within the supplier), VENDOR_LOCATION can be set to PLANT to indicate that the locations should only include the plant shipments from the supplier, not shipments from distribution centres. Because it is a filter, VENDOR_LOCATION does not have a corresponding location value.
