## Bedside scanning ...

- The final checkpoint !
- Requirements
  - Fully deployed CPOE
  - Hardware and software
  - Barcode on every single dose
  - *Change management*
  - *Education of staff*
  - *Escape-procedure*

**MUST  
HAVE!**

CPOE: check

Hardware / Software : check

Single dose barcoded medication : D.I.Y & W.I.P.  
 → >95 % of doses are scannable (in UZ Leuven)

# Our needs ...

- Step 1: Identification
  - Unique identifier
    - Used in translation tables (1 on n relation)
    - Link to databases (measures, photo's, leaflets, ...)
  
- Step 2 : Traceability
  - Batch / serial
  - Expiration date
  - *Already feasible for non-blister ?!*

# Approaches ...

- Non-believers
  - Wait and see
- Believers without support
  - Try locally
  - Sometimes creative
- Visionaries
  - European or global approach
  - GS1 standard

# Repacking interferes with logistics

- Impact on stock (<> EOQ)
- Impact on costs (<> dirtft)
- Impact on stability / quality ? (<> GxP)
- Impact on forecasting pharma industry (<> EOQ)
- Triggers for stock rupture on market

# Repacking interferes with logistics

- What in case of recall ?
- What in case of change of guidelines ?
- Pops up in tendering dossiers (asset value)
- Liability in case of incident ?
- Risk in battle against counterfeiting

# Pitfalls and challenges

- Escape scenario
  - Exceptional but safe and easy
- Barcodescanners cannot read “]d2”
  - No recognition / interpreting GS1
- Medication in clinical trials
  - Complete anarchy (~ annex 13)
  - Phonebook is easier to read
  - Source of errors

MAKE THE **RIGHT** CHOICE
